

**Innovative Timber Composites:
Improving wood with other materials**

17 October 2013 – Nicosia, Cyprus

**Enhanced timber properties with
FRP composites**

Robert Kliger, Alann André and Reza Haghani
Chalmers University of Technology, Gothenburg,
Sweden

 **cost**
EUROPEAN COOPERATION
IN SCIENCE AND TECHNOLOGY

COST FP1004 – Enhance mechanical properties of timber,
engineered wood products and timber structures

Background

Issues/problems

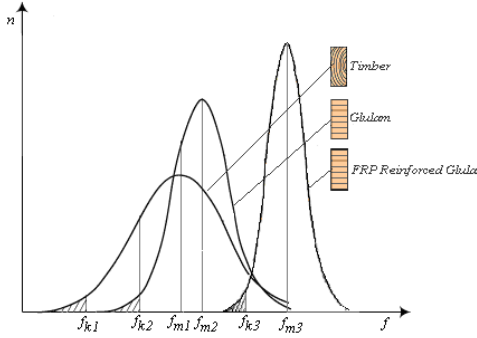

- Poor performance of glulam beams in bending
- Low stiffness
 - Beam size/depth
- Poor long-term behaviour
 - Large reduction in MOE due to creep values
- Low ductility
 - Sudden brittle failures

 **cost**
EUROPEAN COOPERATION
IN SCIENCE AND TECHNOLOGY

COST FP1004 – Enhance mechanical properties of timber,
engineered wood products and timber structures

Background

Effects and opportunities

- Increased stiffness
- Lower variability
- Higher ductility

cost
EUROPEAN COOPERATION
IN SCIENCE AND TECHNOLOGY

COST FP1004 – Enhance mechanical properties of timber, engineered wood products and timber structures

Background

Scope of this presentation

Four studies to be presented:

- **Strengthening of glulam beams**
- **Strengthening timber for long-term performance**
- **Strengthening the compression side of a beam**
- **Strengthening glulam beams with pre-stressed FRP**

cost
EUROPEAN COOPERATION
IN SCIENCE AND TECHNOLOGY

COST FP1004 – Enhance mechanical properties of timber, engineered wood products and timber structures

Strengthening glulam beams

First study - objectives

- Identify and optimise effective ways to maximise strength/stiffness properties
- Identify possible failure modes
- Compare steel with CFRP as reinforcement for strengthening glulam
- Identify opportunity to induce ductility

COST FP1004 – Enhance mechanical properties of timber, engineered wood products and timber structures

Strengthening glulam beams

First study - tests

CFRP
Steel

COST FP1004 – Enhance mechanical properties of timber, engineered wood products and timber structures

Strengthening glulam beams

First study - reinforcements

Steel

- Steel plates (30 x 4 mm)
- Material model
 - Linear-elastic – elastic-plastic
 - Tension and compression

Property	Value
Yield Strength (<i>f_{yk}</i>)	275-300 N/mm ²
Modulus of elasticity	210 000 N/mm ²

COST FP1004 – Enhance mechanical properties of timber, engineered wood products and timber structures

Strengthening glulam beams

First study - reinforcements

CFRP (Carbon Fibre Reinforced Polymers)

- Sika CarboDur S
 - High strength
- Sika CarboDur H
 - High stiffness
- Material model
 - Linear-elastic

<i>Elastic Modulus</i>	
<i>Sika CarboDur S</i>	165,000 N/mm ²
<i>Sika CarboDur H</i>	300,000 N/mm ²
<i>Tensile Strength*</i>	
<i>Sika CarboDur S</i>	2,800 N/mm ²
<i>Sika CarboDur H</i>	1,300 N/mm ²

COST FP1004 – Enhance mechanical properties of timber, engineered wood products and timber structures

Strengthening glulam beams

First study - reinforcements

Adhesives

- **Sikadur 30**
 - Cement paste-like
 - Dense, less viscous

<i>Sikadur 30</i>	
Density	1.77 kg/L (A + B)
Shear strength*	15 MPa
E-Modulus*	12,800 MPa

- **Sikadur 330**
 - Paste-like
 - Viscous

<i>Sikadur 330</i>	
Density	1.31 kg/L (A + B)
Shear strength*	10 MPa
E-Modulus*	3800 MPa

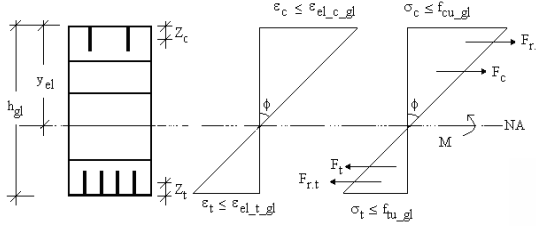

COST FP1004 – Enhance mechanical properties of timber, engineered wood products and timber structures

Strengthening glulam beams

First study - non-linear model

Linear-elastic phase

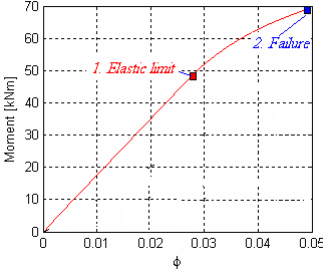

Glulam

$f_t = 44 \text{ MPa}$

$f_c = 46 \text{ MPa}$

$E = 13.5 \text{ GPa}$

- Timber is linear elastic
- Yielding of reinforcement is considered

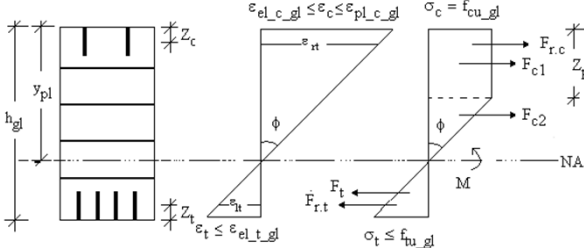

COST FP1004 – Enhance mechanical properties of timber, engineered wood products and timber structures

Strengthening glulam beams

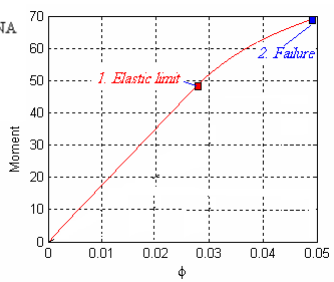

First study - non-linear model

Plastic phase

CFRP
 $f = 2800$ or 1300 MPa
 $E = 165$ or 300 GPa

- Timber plasticises
- Yielding of reinforcement is considered

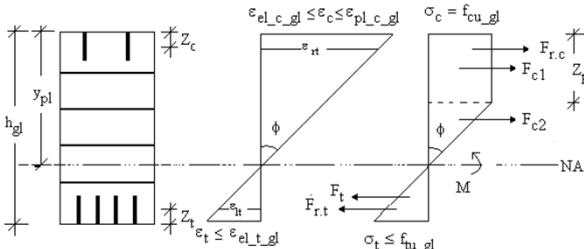

COST FP1004 – Enhance mechanical properties of timber, engineered wood products and timber structures

Strengthening glulam beams

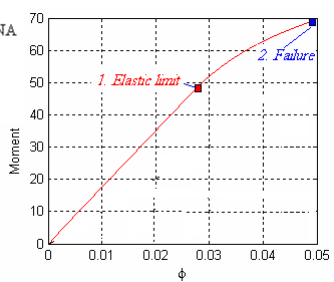

First study - Non-linear model

Plastic phase

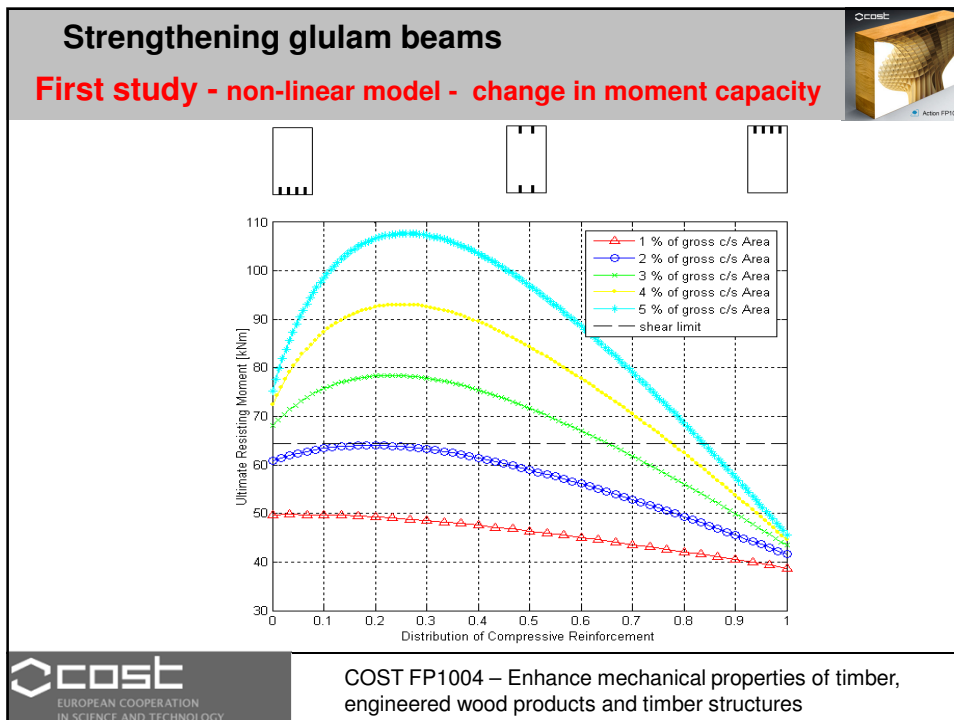

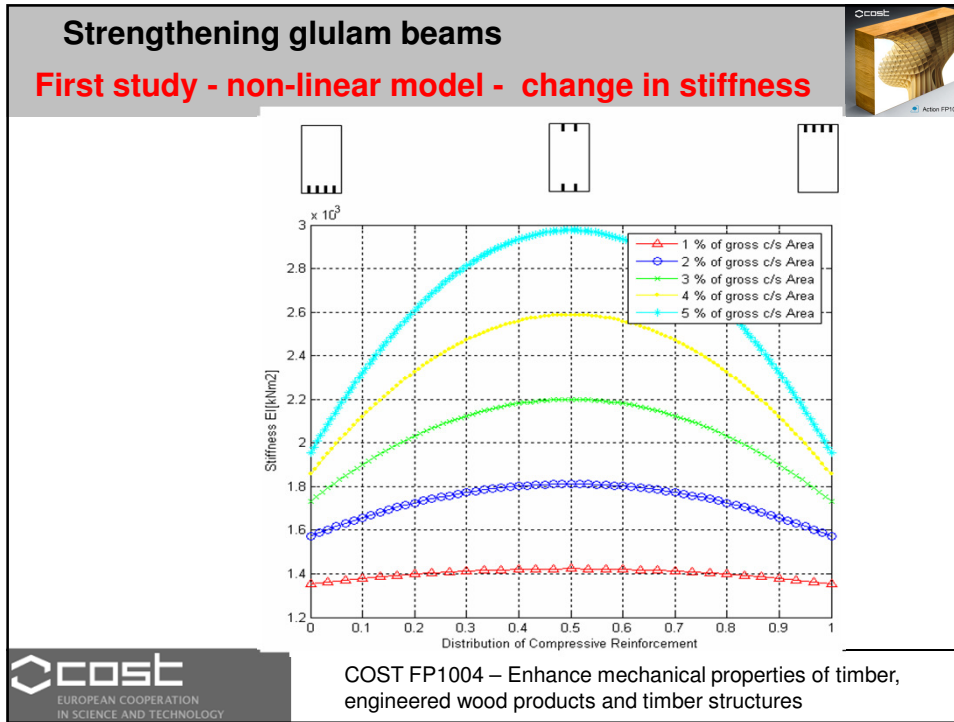

CFRP
 $f = 2800$ or 1300 MPa
 $E = 165$ or 300 GPa

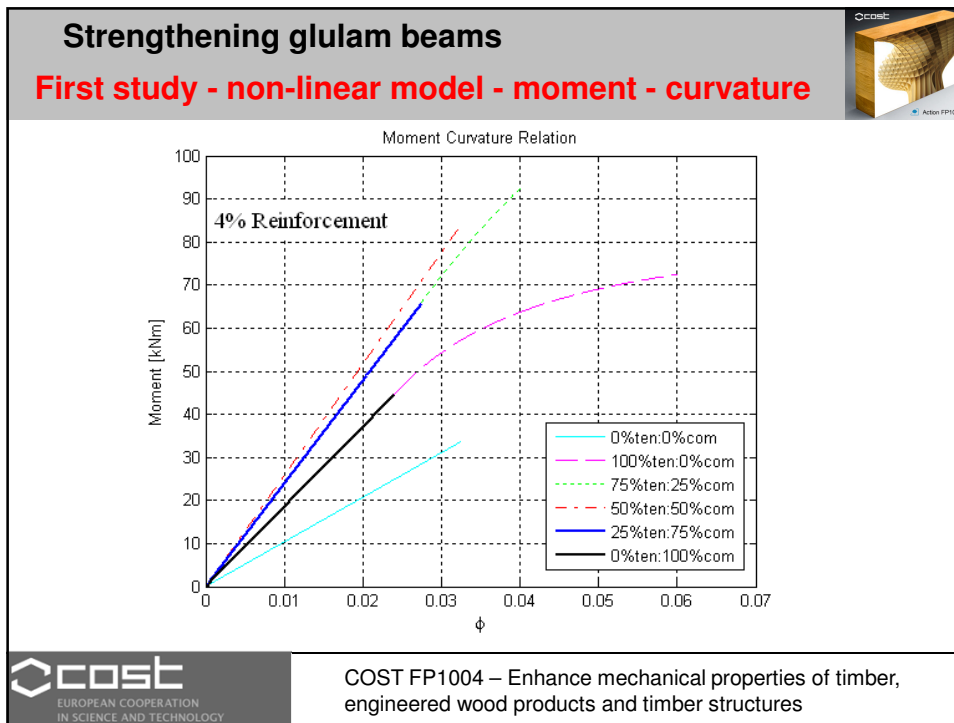

- Timber plasticises
- Yielding of reinforcement is considered

COST FP1004 – Enhance mechanical properties of timber, engineered wood products and timber structures

Strengthening glulam beams

First study – experimental results

Buckling of CFRP

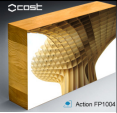

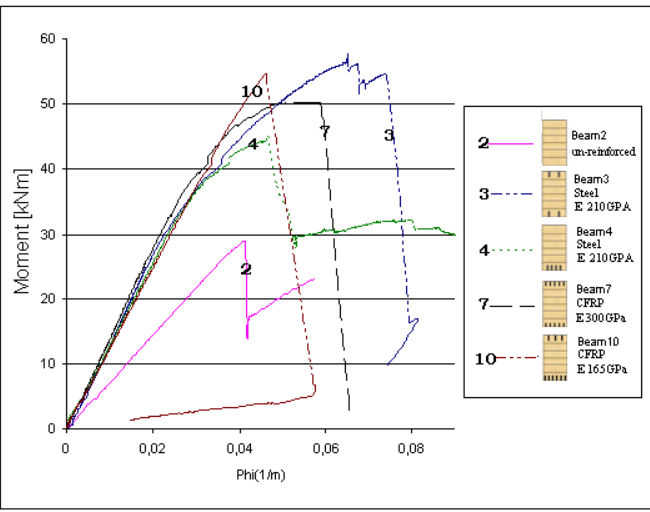

COST FP1004 – Enhance mechanical properties of timber, engineered wood products and timber structures

Strengthening glulam beams

First study – experimental results

COST FP1004 – Enhance mechanical properties of timber, engineered wood products and timber structures

Strengthening glulam beams

First study – experimental results

Shear failure in glulam

Strengthening glulam beams

First study – experimental results

EUROPEAN COOPERATION
IN SCIENCE AND TECHNOLOGY

COST FP1004 – Enhance mechanical properties of timber,
engineered wood products and timber structures

Strengthening glulam beams

First study – conclusions

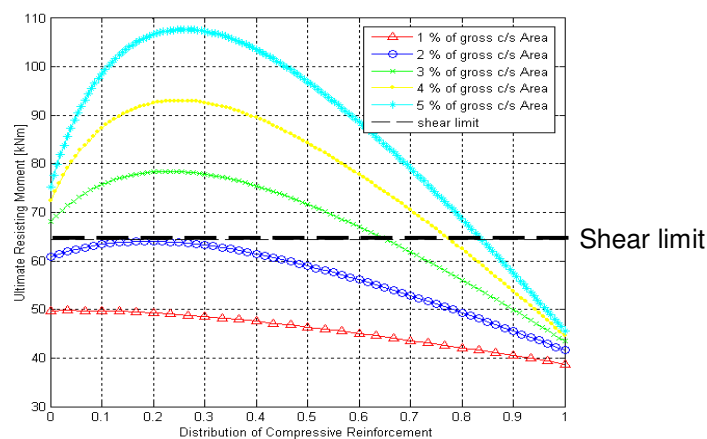

- Higher stiffness and higher moment capacity can be obtained
- Amount and position of reinforcement determine the behaviour of the beam
 - Ductility
 - Failure modes
 - Strength
 - Stiffness
- Results from model and tests agreed

COST FP1004 – Enhance mechanical properties of timber, engineered wood products and timber structures

Strengthening glulam beams

First study - non-linear model - change in moment capacity

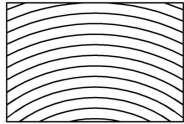

COST FP1004 – Enhance mechanical properties of timber, engineered wood products and timber structures

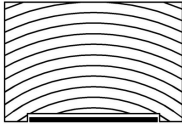

Strengthening for long-term performance
Second study: creep test – timber specimens

4 types of beam with 6 specimens in each
 In all, 24 specimens, pine sapwood, 45 x 70 x 1100 mm³

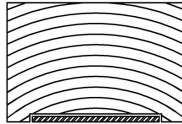

Timber & epoxy

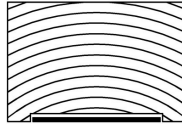

CFRP-165

Steel

CFRP-300

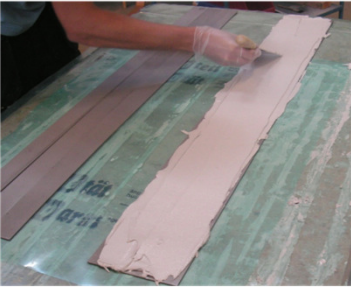

Beam type	Reinforcement	Size	E-modulus	Tensile strength
1	-	-	-	-
2	CFK 150/2000	70 mm ²	165 GPa	2310 MPa
3	CarboDur H514	70 mm ²	300 GPa	1350 MPa
4	Steel	100 mm ²	210 GPa	235 MPa

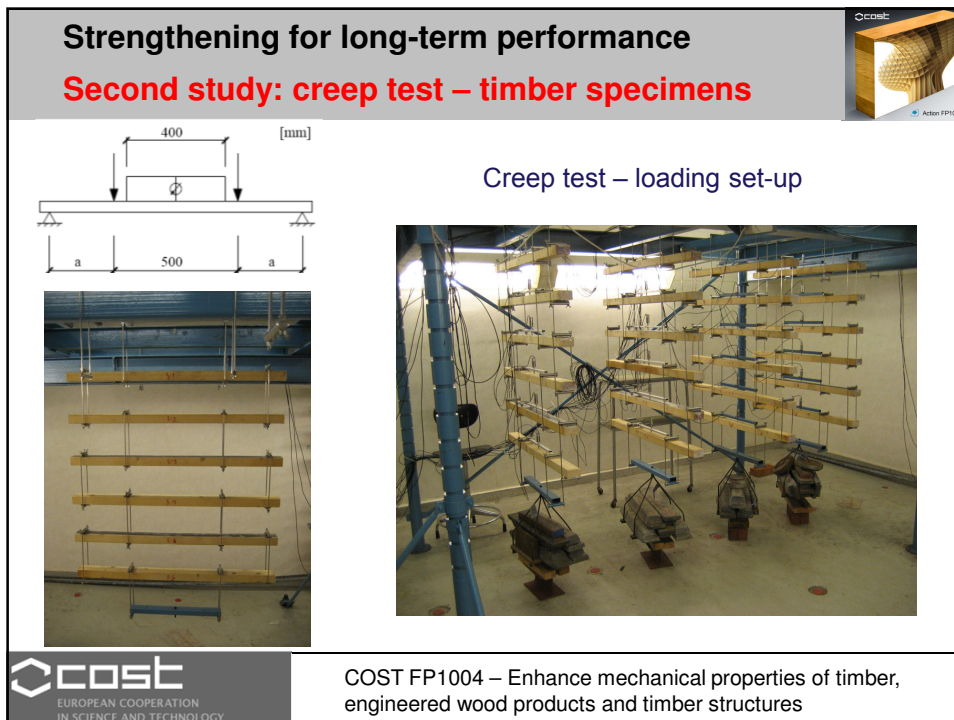

COST FP1004 – Enhance mechanical properties of timber, engineered wood products and timber structures

Strengthening for long-term performance
Second study: creep test – timber specimens

COST FP1004 – Enhance mechanical properties of timber, engineered wood products and timber structures

Strengthening for long-term performance

Second study: creep test – timber specimens

- Stiffness of timber beams can easily be increased by applying reinforcement
- Large variation in deflection due to constrained swelling/shrinkage when reinforced on one side only
- Less creep in reinforced timber beams
- Tendency towards less mechano-sorptive creep for beams with higher initial stiffness

IN SCIENCE AND TECHNOLOGY

Strengthening glulam beams with pre-stressed FRP

Fourth study: why do we need pre-stressing?

- + More efficient use of FRP materials
- + Reduction in deflection, SLS
- + Reduction in beam cross-section
- + More efficient use of materials

- High stress concentration
- Need for mechanical anchorage, when strengthening existing structures

ANCHORAGE OF FRP TO (RC) CONCRETE BEAMS

COST FP1004 – Enhance mechanical properties of timber, engineered wood products and timber structures

Strengthening glulam beams with pre-stressed FRP

Fourth study: pre-stressing

Axial force in laminate

Distance from laminate end

Method using high pre-stressing forces without the need for mechanical anchorage has been developed at Chalmers

Shear stress

Distance from laminate end

The basic concept is stepwise linking
Relationship between distribution of axial pre-stressing force and shear stress vs. distance from the laminate end according to the traditional pre-stressing method and the proposed new method

COST FP1004 – Enhance mechanical properties of timber, engineered wood products and timber structures

Strengthening glulam beams with pre-stressed FRP

Fourth study: pre-stressing

COST FP1004 – Enhance mechanical properties of timber, engineered wood products and timber structures

Enhanced timber properties with FRP composites

Conclusions

- Glulam beams can be effectively improved with FRP composites when it comes to ductility and long-term performance
- The best way is to reinforce on both tension and compression sides
- The limit for the amount of FRP is max 2% of cross-section area of the beam
- The accuracy of prediction of the compression strength is strongly related to the choice of the wood material model
- Pre-stressed FRP on the tension side is the most effective way of enhancing large glulam beams

COST FP1004 – Enhance mechanical properties of timber, engineered wood products and timber structures
